**Background:**

This gene encodes a cell surface membrane protein of the immunoglobulin superfamily. This protein is expressed in pro-B-cells and is thought to play a role in their differentiation. In mice, expression of this gene is induced in the thymus when anti-CD3 antibodies are injected and large numbers of thymocytes undergo apoptosis. Mice deficient for this gene bred on a BALB/c background developed dilated cardiomyopathy and died from congestive heart failure. These studies suggest that this gene product may also be important in T cell function and contribute to the prevention of autoimmune diseases. [provided by RefSeq, Jul 2008]

**Synonyms:**

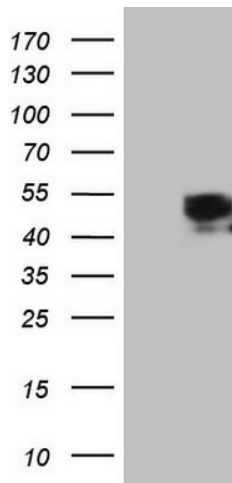

CD279; hPD-1; hPD-I; hSLE1; PD-1; PD1; SLEB2

**Protein Families:**

Druggable Genome, Transmembrane

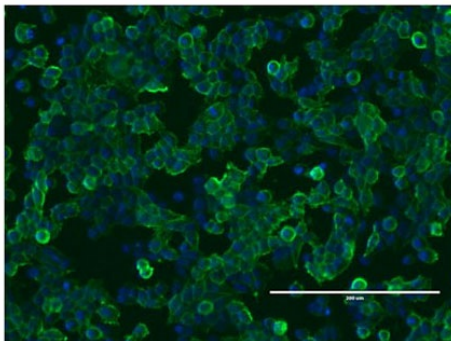

**Protein Pathways:**

Cell adhesion molecules (CAMs), T cell receptor signaling pathway

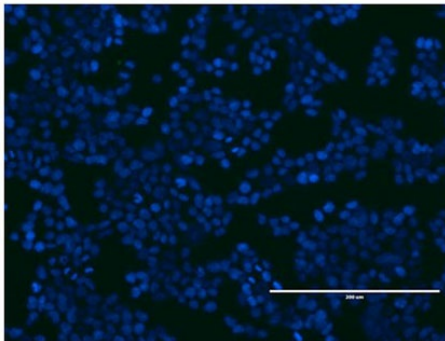

**Product images:**

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY PDCD1 ([RC210364], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-PDCD1 (1:2000). Positive lysates [LY401555] (100ug) and [LC401555] (20ug) can be purchased separately from OriGene.
