ORIGENE	MNDA Mouse Monoclonal Antibody [Clone ID: OTI4H6] – TA807178S

Background:The myeloid cell nuclear differentiation antigen (MNDA) is detected only in nuclei of cells of
the granulocyte-monocyte lineage. A 200-amino acid region of human MNDA is strikingly
similar to a region in the proteins encoded by a family of interferon-inducible mouse genes,
designated Ifi-201, Ifi-202, and Ifi-203, that are not regulated in a cell- or tissue-specific
fashion. The 1.8-kb MNDA mRNA, which contains an interferon-stimulated response element
in the 5-prime untranslated region, was significantly upregulated in human monocytes
exposed to interferon alpha. MNDA is located within 2,200 kb of FCER1A, APCS, CRP, and
SPTA1. In its pattern of expression and/or regulation, MNDA resembles IFI16, suggesting that
these genes participate in blood cell-specific responses to interferons. [provided by RefSeq,

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY MNDA (Cat# [RC207117], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MNDA(Cat# [TA807178]). Positive lysates [LY400871] (100ug) and [LC400871] (20ug) can be purchased separately from OriGene.
