	CD3E Mouse Monoclonal Antibody [Clone ID: UCHT1] – TA807198M
Background:	The protein encoded by this gene is the CD3-epsilon polypeptide, which together with CD3- gamma, -delta and -zeta, and the T-cell receptor alpha/beta and gamma/delta heterodimers, forms the T-cell receptor-CD3 complex. This complex plays an important role in coupling antigen recognition to several intracellular signal-transduction pathways. The genes encoding the epsilon, gamma and delta polypeptides are located in the same cluster on chromosome 11. The epsilon polypeptide plays an essential role in T-cell development. Defects in this gene cause immunodeficiency. This gene has also been linked to a susceptibility to type I diabetes in women. [provided by RefSeq, Jul 2008]
Synonyms:	IMD18; T3E; TCRE
Protein Families:	Druggable Genome, Transmembrane
Protein Pathway	<b>s:</b> Hematopoietic cell lineage, Primary immunodeficiency, T cell receptor signaling pathway

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CD3 ([RC208276], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CD3 (1:2000). Positive lysates [LY400242] (100ug) and [LC400242] (20ug) can be purchased separately from OriGene.
