GRIGENE FBXO8 Mouse Monoclonal Antibody [Clone ID: OTI7E12] – TA807552M

Background:This gene encodes a member of the F-box protein family which is characterized by an
approximately 40 amino acid motif, the F-box. The F-box proteins constitute one of the four
subunits of the ubiquitin protein ligase complex called SCFs (SKP1-cullin-F-box), which
function in phosphorylation-dependent ubiquitination. The F-box proteins are divided into 3
classes: Fbws containing WD-40 domains, Fbls containing leucine-rich repeats, and Fbxs
containing either different protein-protein interaction modules or no recognizable motifs. The
protein encoded by this gene belongs to the Fbxs class. It contains a C-terminal amino acid
sequence that bears a significant similarity with a portion of yeast Sec7p, a critical regulator
of vesicular protein transport. This human protein may interact with ADP-ribosylation
factor(s)(ARFs) and exhibit ARF-GEF (guanine nucleotide exchange factor) activity. [provided

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY FBXO8 ([RC202154], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-FBXO8. Positive lysates [LY415927] (100ug) and [LC415927] (20ug) can be purchased separately from OriGene.
