Background:

NDUFB11 is a component of mitochondrial complex I. Complex I catalyzes the first step in the electron transport chain, the transfer of 2 electrons from NADH to ubiquinone, coupled to the translocation of 4 protons across the membrane (Carroll et al., 2002 [PubMed 12381726]). [supplied by OMIM, Feb 2009]. Transcript Variant: This variant (2) uses a different splice site in the 3' coding region, compared to variant 1. The resulting protein (isoform 2) has a shorter C-terminus when it is compared to isoform 1. ##Evidence-Data-START## Transcript exon combination :: AY359056.1, BE781599.1 [ECO:0000332] RNAseq introns :: single sample supports all introns ERS025084, ERS025087 [ECO:0000348] ##Evidence-Data-END## ##RefSeq-Attributes-START## gene product(s) localized to mito. :: reported by MitoCarta ##RefSeq-Attributes-END##

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY NDUFB11 ([RC213937], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-NDUFB11 (1:2000). Positive lysates [LY412795] (100ug) and [LC412795] (20ug) can be purchased separately from OriGene.
