| Background:<br>Synonyms: | Troponin I (TnI), along with troponin T (TnT) and troponin C (TnC), is one of 3 subunits that<br>form the troponin complex of the thin filaments of striated muscle. TnI is the inhibitory<br>subunit; blocking actin-myosin interactions and thereby mediating striated muscle relaxation.<br>The TnI subfamily contains three genes: TnI-skeletal-fast-twitch, TnI-skeletal-slow-twitch, and<br>TnI-cardiac. This gene encodes the TnI-cardiac protein and is exclusively expressed in cardiac<br>muscle tissues. Mutations in this gene cause familial hypertrophic cardiomyopathy type 7<br>(CMH7) and familial restrictive cardiomyopathy (RCM). HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY TNNT2 ([RC214180], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-TNNT2. Positive lysates [LY400130] (100ug) and [LC400130] (20ug) can be purchased separately from OriGene.

Immunohistochemical staining of paraffinembedded Human adult heart tissue using anti-TNNT2 mouse monoclonal antibody. Heatinduced epitope retrieval by EDTA solution buffer pH 8.0 at 120°C for 3 min.
