🕊 ORÏGENE 🛛 TTF1 (NKX2-1) Mouse Monoclonal Antibody (HRP conjugated) [Clone ID: OTI8E2] – TA808478BM

Background:	This gene encodes a protein initially identified as a thyroid-specific transcription factor. The
	encoded protein binds to the thyroglobulin promoter and regulates the expression of
	thyroid-specific genes but has also been shown to regulate the expression of genes involved
	in morphogenesis. Mutations and deletions in this gene are associated with benign hereditary
	chorea, choreoathetosis, congenital hypothyroidism, and neonatal respiratory distress, and
	may be associated with thyroid cancer. Multiple transcript variants encoding different
	isoforms have been found for this gene. This gene shares the symbol/alias 'TTF1' with
	another gene, transcription termination factor 1, which plays a role in ribosomal gene
	transcription. [provided by RefSeq, Feb 2014]

Product images:

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY NKX2-1 ([RC217520], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-NKX2-1 (1:2000). Positive lysates [LY401141] (100ug) and [LC401141] (20ug) can be purchased separately from OriGene.
