| Background:             | This gene is a member of the MAD gene family . The MAD genes encode basic helix-loop-<br>helix-leucine zipper proteins that heterodimerize with MAX protein, forming a transcriptional<br>repression complex. The MAD proteins compete for MAX binding with MYC, which<br>heterodimerizes with MAX forming a transcriptional activation complex. Studies in rodents<br>suggest that the MAD genes are tumor suppressors and contribute to the regulation of cell<br>growth in differentiating tissues. [provided by RefSeq, Jul 2008] |

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY MXD4 (Cat# [RC209651], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MXD4 (Cat# [TA808928])(1:2000). Positive lysates [LY416638] (100ug) and [LC416638] (20ug) can be purchased separately from OriGene.
