Section 224 PEG10 Mouse Monoclonal Antibody [Clone ID: OTI1G10] – TA809524

Background:This is a paternally expressed imprinted gene that encodes transcripts containing two
overlapping open reading frames (ORFs), RF1 and RF1/RF2, as well as retroviral-like slippage
and pseudoknot elements, which can induce a -1 nucleotide frame-shift. ORF1 encodes a
shorter isoform with a CCHC-type zinc finger motif containing a sequence characteristic of
gag proteins of most retroviruses and some retrotransposons. The longer isoform is the
result of -1 translational frame-shifting leading to translation of a gag/pol-like protein
combining RF1 and RF2. It contains the active-site consensus sequence of the protease
domain of pol proteins. Additional isoforms resulting from alternatively spliced transcript
variants, as well as from use of upstream non-AUG (CUG) start codon, have been reported for
this gene. Increased expression of this gene is associated with hepatocellular carcinomas.

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY PEG10 (Cat# [RC208683], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-PEG10. (1:2000) (Cat# TA809524)(1:500). Positive lysates [LY421697] (100ug) and [LC421697] (20ug) can be purchased separately from OriGene.
