	Transaldolase 1 (TALDO1) Mouse Monoclonal Antibody [Clone ID: OTI1E5] – TA809858
Background:	Transaldolase 1 is a key enzyme of the nonoxidative pentose phosphate pathway providing ribose-5-phosphate for nucleic acid synthesis and NADPH for lipid biosynthesis. This pathway can also maintain glutathione at a reduced state and thus protect sulfhydryl groups and cellular integrity from oxygen radicals. The functional gene of transaldolase 1 is located on chromosome 11 and a pseudogene is identified on chromosome 1 but there are conflicting map locations. The second and third exon of this gene were developed by insertion of a retrotransposable element. This gene is thought to be involved in multiple sclerosis. [provided by RefSeq, Jul 2008]
Synonyms:	TAL; TAL-H; TALDOR; TALH
Protein Families:	Druggable Genome
Protein Pathways	S: Metabolic pathways, Pentose phosphate pathway

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY TALDO1 ([RC204049], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-TALDO1 (1:2000). Positive lysates [LY402020] (100ug) and [LC402020] (20ug) can be purchased separately from OriGene.
