| Background: | This gene was identified as a locus frequently mutated in hereditary nonpolyposis colon cancer (HNPCC). It is a human homolog of the E. coli DNA mismatch repair gene mutL, consistent with the characteristic alterations in microsatellite sequences (RER+phenotype) found in HNPCC. Alternative splicing results in multiple transcript variants encoding distinct isoforms. Additional transcript variants have been described, but their full-length natures have not been determined. Protein Pathways:

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY MLH1 ([RC201607], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MLH1 (1:2000). Positive lysates [LY400096] (100ug) and [LC400096] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 3 different cell lines by using anti-MLH1 monoclonal antibody (1:500).
