# PGBD3 Mouse Monoclonal Antibody [Clone ID: OTI3H1] - TA810308Background:This gene is a member of a small family of genes derived from piggyBac transposable<br/>elements. The encoded protein contains a zinc-ribbon domain characteristic of transposon-<br/>derived proteins and may function as a regulator of transcription. Alternative splicing occurs<br/>between a splice site from exon 5 of the adjacent upstream gene 'excision repair cross-<br/>complementation group 6' (ERCC6, GeneID: 2074) and the 3' splice site upstream of the open<br/>reading frame (ORF) of this gene, which activates the alternative polyadenylation site<br/>downstream of the piggyback-derived-3 ORF. The resulting transcripts encode a fusion<br/>protein that shares sequence with the product of each individual gene. Pseudogenes for this<br/>gene are defined on chromosomes 4, 5 and 12. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY PGBD3 ([RC208977], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-PGBD3 (1:2000). Positive lysates [LY406870] (100ug) and [LC406870] (20ug) can be purchased separately from OriGene.
