Background:

C2H2 zinc finger proteins, such as ZNF213, have bipartite structures in which one domain binds DNA or RNA and the other modulates target gene expression. [supplied by OMIM, Apr 2004]. Transcript Variant: This variant (3) uses an alternate splice junction at the 5' end of an exon compare to variant 1. This variant is represented as non-coding because the use of the 5'-most expected translational start codon, as used in variant 1, renders the transcript a candidate for nonsense-mediated mRNA decay (NMD). ##Evidence-Data-START## RNAseq introns :: single sample supports all introns ERS025083, ERS025085 [ECO:0000348] ##Evidence-Data-END## COMPLETENESS: complete on the 3' end.

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY ZNF213 (Cat# [RC203547], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-ZNF213 (Cat# [TA810393])(1:500). Positive lysates [LY418147] (100ug) and [LC418147] (20ug) can be purchased separately from OriGene.
