Background: Pre-mRNA splicing occurs in two sequential transesterification steps. The protein encoded by

this gene is a splicing factor that has been found to be essential during the second catalytic step in the pre-mRNA splicing process. It associates with the spliceosome and contains a zinc knuckle motif that is found in other splicing factors and is involved in protein-nucleic acid and

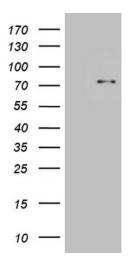

protein-protein interactions. [provided by RefSeq, Jul 2008]

Synonyms: 9G8; hSlu7
Protein Pathways: Spliceosome

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY SLU7 ([RC202113], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-SLU7. Positive lysates [LY416650] (100ug) and [LC416650] (20ug) can be purchased separately from OriGene.
