QRIGENE ATP5ME Mouse Monoclonal Antibody (Biotin conjugated) [Clone ID: OTI1E6] – TA811780AM

Background: Mitochondrial ATP synthase catalyzes ATP synthesis, utilizing an electrochemical gradient of protons across the inner membrane during oxidative phosphorylation. It is composed of two linked multi-subunit complexes: the soluble catalytic core, F1, and the membrane-spanning component, Fo, which comprises the proton channel. The F1 complex consists of 5 different subunits (alpha, beta, gamma, delta, and epsilon) assembled in a ratio of 3 alpha, 3 beta, and a single representative of the other 3. The Fo seems to have nine subunits (a, b, c, d, e, f, g, F6 and 8). This gene encodes the e subunit of the Fo complex. Alternative splicing results in multiple transcript variants. HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY ATP5I (Cat# [RC215565], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-ATP5I (Cat# [TA811780])(1:2000). Positive lysates [LY416195] (100ug) and [LC416195] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 2 different cell lines by using anti-ATP5I monoclonal antibody (1:500).
