	RIGENE KLF5 Mouse Monoclonal Antibody [Clone ID: OTI1E4] – TA811878S	
Background:	This gene encodes a member of the Kruppel-like factor subfamily of zinc finger proteins. The encoded protein is a transcriptional activator that binds directly to a specific recognition motif in the promoters of target genes. This protein acts downstream of multiple different signaling pathways and is regulated by post-translational modification. It may participate in both promoting and suppressing cell proliferation. Expression of this gene may be changed in a variety of different cancers and in cardiovascular disease. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Nov 2013]	
Synonyms:	BTEB2; CKLF; IKLF	
Protein Families	Embryonic stem cells, ES Cell Differentiation/IPS, Induced pluripotent stem cells, Transcription Factors

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY KLF5 ([RC202438], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-KLF5. Positive lysates [LY419775] (100ug) and [LC419775] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 2 cell lines by using anti-KLF5 monoclonal antibody (1:500).
