Background: The protein encoded by this gene is a member of the Kruppel-like transcriptional regulator

family. Members in this family regulate cell proliferation, differentiation and survival and contain three C2H2 zinc fingers at the C-terminus that mediate binding to GC-rich sites. This protein may contribute to the progression of type 2 diabetes by inhibiting insulin expression and secretion in pancreatic beta-cells and by deregulating adipocytokine secretion in

adipocytes. A pseudogene of this gene is located on the long arm of chromosome 3.

Alternative splicing results in multiple transcript variants. [provided by RefSeq, Aug 2012]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY KLF7 ([RC215688], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-KLF7. Positive lysates [LY418489] (100ug) and [LC418489] (20ug) can be purchased separately from OriGene.
