Background:	This gene encodes an enzyme that catalyzes the epimerization of hexose sugars such as glucose and galactose. The encoded protein is expressed in the cytoplasm and has a preference for galactose. The encoded protein may be required for normal galactose metabolism by maintaining the equilibrium of alpha and beta anomers of galactose. [provided by RefSeq, Mar 2009]

Product images:

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY GALM ([RC200995], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-GALM. Positive lysates [LY408487] (100ug) and [LC408487] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from cell lines by using anti-GALM monoclonal antibody (1:500).
