|------------------------------|--|
| Background:                  | The protein encoded by this gene belongs to the immunoglobulin superfamily, and TIM family<br>of proteins. CD4-positive T helper lymphocytes can be divided into types 1 (Th1) and 2 (Th2)<br>on the basis of their cytokine secretion patterns. Th1 cells are involved in cell-mediated<br>immunity to intracellular pathogens and delayed-type hypersensitivity reactions, whereas,<br>Th2 cells are involved in the control of extracellular helminthic infections and the promotion<br>of atopic and allergic diseases. This protein is a Th1-specific cell surface protein that regulates<br>macrophage activation, and inhibits Th1-mediated auto- and alloimmune responses, and<br>promotes immunological tolerance. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY HAVCR2 ([RC209440], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-HAVCR. Positive lysates [LY403200] (100ug) and [LC403200] (20ug) can be purchased separately from OriGene.

Flow cytometric analysis of living 293T cells transfected with HAVCR2 overexpression plasmid ([RC209440]), Red)/empty vector ([PS100001], Blue) using anti-HAVCR2 antibody ([TA812500]). Cells incubated with a non-specific antibody (Green) were used as isotype control (1:100).
