Background:	This gene encodes a member of the TFB4 family. The encoded protein is a subunit of the core-TFIIH basal transcription factor and localizes to the nucleus. The encoded protein is involved in RNA transcription by RNA polymerase II and nucleotide excision repair and associates with the Cdk-activating kinase complex. Alternative splicing results in multiple transcript variants. A related pseudogene has been identified on chromosome 14. [provided by RefSeq, Dec 2012]

Equivalent amounts of cell lysates (30 ug per lane) of wild-type HeLa cells (WT) and GTF2H3-Knockdown HeLa cells (KD) were separated by SDS-PAGE and immunoblotted with anti-GTF2H3 monoclonal antibody [TA812723] (1:1000). Then the blotted membrane was stripped and reprobed with anti-HSP90AA1 antibody as a loading control.

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY GTF2H3 ([RC209399], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-GTF2H3 (1:500). Positive lysates [LY419886] (100ug) and [LC419886] (20ug) can be purchased separately from OriGene.
