	EWSR1 Mouse Monoclonal Antibody (HRP conjugated) [Clone ID: OTI2G3] – TA813055BM

Background:This gene encodes a multifunctional protein that is involved in various cellular processes,<br/>including gene expression, cell signaling, and RNA processing and transport. The protein<br/>includes an N-terminal transcriptional activation domain and a C-terminal RNA-binding<br/>domain. Chromosomal translocations between this gene and various genes encoding<br/>transcription factors result in the production of chimeric proteins that are involved in<br/>tumorigenesis. These chimeric proteins usually consist of the N-terminal transcriptional<br/>activation domain of this protein fused to the C-terminal DNA-binding domain of the<br/>transcription factor protein. Mutations in this gene, specifically a t(11;22)(q24;q12)<br/>translocation, are known to cause Ewing sarcoma as well as neuroectodermal and various<br/>other tumors. Alternative splicing of this gene results in multiple transcript variants. Related<br/>pseudogenes have been identified on chromosomes 1 and 14. [provided by RefSeq, Jul 2009]
