Background:	This gene encodes a downstream nuclear effector of the Hippo signaling pathway which is involved in development, growth, repair, and homeostasis. This gene is known to play a role in the development and progression of multiple cancers as a transcriptional regulator of this signaling pathway and may function as a potential target for cancer treatment. Alternative splicing results in multiple transcript variants encoding different isoforms. [provided by RefSeq, Aug 2013]
Synonyms:	COB1; YAP; YAP2; YAP65; YKI

Equivalent amounts of cell lysates (10 ug per lane) of wild-type HeLa cells (WT, Cat# LC810HELA) and YAP1-Knockout HeLa cells (KO, Cat# [LC832485]) were separated by SDS-PAGE and immunoblotted with anti-YAP1 monoclonal antibody [TA813311] (1:500). Then the blotted membrane was stripped and reprobed with anti-PCNA antibody as a loading control.

Western blot analysis of extracts (35ug) from 5 cell lines lysates by using anti-YAP1 monoclonal antibody (1:1000).
