| Background:             | This gene encodes a cytokine that functions in inflammation and the maturation of B cells. In<br>addition, the encoded protein has been shown to be an endogenous pyrogen capable of<br>inducing fever in people with autoimmune diseases or infections. The protein is primarily<br>produced at sites of acute and chronic inflammation, where it is secreted into the serum and<br>induces a transcriptional inflammatory response through interleukin 6 receptor, alpha. The<br>functioning of this gene is implicated in a wide variety of inflammation-associated disease<br>states, including suspectibility to diabetes mellitus and systemic juvenile rheumatoid arthritis.<br>Alternative splicing results in multiple transcript variants.
