#### **GRIGENE** p63 (TP63) Mouse Monoclonal Antibody [Clone ID: OTI2E12] – TA815255S

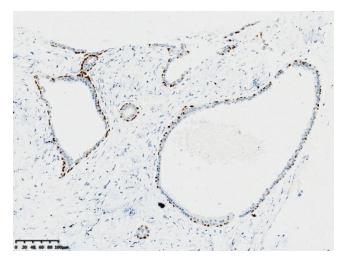

Background:This gene encodes a member of the p53 family of transcription factors. The functional<br/>domains of p53 family proteins include an N-terminal transactivation domain, a central DNA-<br/>binding domain and an oligomerization domain. Alternative splicing of this gene and the use<br/>of alternative promoters results in multiple transcript variants encoding different isoforms<br/>that vary in their functional properties. These isoforms function during skin development and<br/>maintenance, adult stem/progenitor cell regulation, heart development and premature aging.<br/>Some isoforms have been found to protect the germline by eliminating oocytes or testicular<br/>germ cells that have suffered DNA damage. Mutations in this gene are associated with<br/>ectodermal dysplasia, and cleft lip/palate syndrome 3 (EEC3); split-hand/foot malformation 4<br/>(SHFM4); ankyloblepharon-ectodermal defects-cleft lip/palate; ADULT syndrome (acro-<br/>dermato-ungual-lacrimal-tooth); limb-mammary syndrome; Rap-Hodgkin syndrome (RHS);<br/>and orofacial cleft 8.
