	PPIL1 (NM_016059) Human Recombinant Protein – TP300015M
Cytogenetics:	6p21.2
RefSeq ORF:	498
Synonyms:	CGI-124; CYPL1; hCyPX; PCH14; PPlase
Summary:	This gene is a member of the cyclophilin family of peptidylprolyl isomerases (PPIases). The cyclophilins are a highly conserved, ubiquitous family, members of which play an important role in protein folding, immunosuppression by cyclosporin A, and infection of HIV-1 virions. Based on similarity to other PPIases, this protein could accelerate the folding of proteins and might catalyze the cis-trans isomerization of proline imidic peptide bonds in oligopeptides. Protein Pathway	rs: Spliceosome
