	LSM1 (NM_014462) Human Recombinant Protein – TP300288
Cytogenetics:	8p11.23
RefSeq ORF:	399
Synonyms:	CASM; YJL124C
Summary:	This gene encodes a member of the LSm family of RNA-binding proteins. LSm proteins form stable heteromers that bind specifically to the 3'-terminal oligo(U) tract of U6 snRNA and may play a role in pre-mRNA splicing by mediating U4/U6 snRNP formation. Increased expression of this gene may play a role in cellular transformation and the progression of several malignancies including lung cancer, mesothelioma and breast cancer. Alternatively spliced transcript variants have been observed for this gene, and a pseudogene of this gene is located on the short arm of chromosome 9. [provided by RefSeq, Nov 2011]
Protein Families:	Stem cell - Pluripotency
Protein Pathway	RNA degradation
