ORIGENE

RefSeq ORF: 390

Synonyms: HIST3H2A

Summary: Histones are basic nuclear proteins that are responsible for the nucleosome structure of the

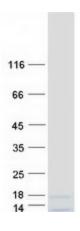

> chromosomal fiber in eukaryotes. Nucleosomes consist of approximately 146 bp of DNA wrapped around a histone octamer composed of pairs of each of the four core histones (H2A, H2B, H3, and H4). The chromatin fiber is further compacted through the interaction of a linker

histone, H1, with the DNA between the nucleosomes to form higher order chromatin structures. This gene is intronless and encodes a replication-dependent histone that is a member of the histone H2A family. Transcripts from this gene contain a palindromic

termination element. [provided by RefSeq, Aug 2015]
