UBE2G1 (NM_003342) Human Recombinant Protein - TP301159M

RefSeq Size: 4208

Cytogenetics: 17p13.2 RefSeq ORF: 510

Synonyms: E217K; UBC7; UBE2G

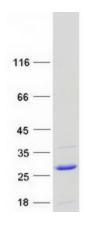

Summary: The modification of proteins with ubiquitin is an important cellular mechanism for targeting

abnormal or short-lived proteins for degradation. Ubiquitination involves at least three classes of enzymes: ubiquitin-activating enzymes, or E1s, ubiquitin-conjugating enzymes, or E2s, and ubiquitin-protein ligases, or E3s. This gene encodes a member of the E2 ubiquitin-conjugating enzyme family and catalyzes the covalent attachment of ubiquitin to other proteins. The protein may be involved in degradation of muscle-specific proteins. [provided
