	ISG15 (NM_005101) Human Recombinant Protein – TP301235
Cytogenetics:	1p36.33
RefSeq ORF:	495
Synonyms:	G1P2; hUCRP; IFI15; IMD38; IP17; UCRP
Summary:	The protein encoded by this gene is a ubiquitin-like protein that is conjugated to intracellular target proteins upon activation by interferon-alpha and interferon-beta. Several functions have been ascribed to the encoded protein, including chemotactic activity towards neutrophils, direction of ligated target proteins to intermediate filaments, cell-to-cell signaling, and antiviral activity during viral infections. While conjugates of this protein have been found to be noncovalently attached to intermediate filaments, this protein is sometimes secreted. [provided by RefSeq, Dec 2012]
Protein Families:	Druggable Genome, Secreted Protein
Protein Pathway	s: RIG-I-like receptor signaling pathway
