Summary: The protein encoded by this gene belongs to the BCL-2 protein family. BCL-2 family members

form hetero- or homodimers and act as anti- or pro-apoptotic regulators that are involved in a wide variety of cellular activities. The proteins encoded by this gene are located at the outer mitochondrial membrane, and have been shown to regulate outer mitochondrial membrane channel (VDAC) opening. VDAC regulates mitochondrial membrane potential, and thus controls the production of reactive oxygen species and release of cytochrome C by mitochondria, both of which are the potent inducers of cell apoptosis. Alternative splicing results in multiple transcript variants encoding two different isoforms. The longer isoform

acts as an apoptotic inhibitor and the shorter isoform acts as an apoptotic activator.

PARK2 E3 ubiquitin ligase ubiquitinates BCL-XL in vitro. Recombinant proteins BCL-XL (OriGene TP301314) and PARK2 were incubated in HEPES buffer, pH 8.0 containing E1, E2, ubiquitin, and Mg2+-ATP. Reactions were cultured for 10 min at 30 C, then 30 - 60 min at 37 C, and reaction samples were subjected to Western blot analysis. Figure cited from Neoplasia, PMID: 28038320

Coomassie blue staining of purified BCL2L1 protein (Cat# TP301314). The protein was produced from HEK293T cells transfected with BCL2L1 cDNA clone (Cat# [RC201314]) using MegaTran 2.0 (Cat# [TT210002]).
