| Summary:         | This gene encodes a uridine 5'-monophosphate synthase. The encoded protein is a<br>bifunctional enzyme that catalyzes the final two steps of the de novo pyrimidine biosynthetic<br>pathway. The first reaction is carried out by the N-terminal enzyme orotate<br>phosphoribosyltransferase which converts orotic acid to orotidine-5'-monophosphate. The<br>terminal reaction is carried out by the C-terminal enzyme OMP decarboxylase which converts<br>orotidine-5'-monophosphate to uridine monophosphate. Defects in this gene are the cause of<br>hereditary orotic aciduria. Alternate splicing results in multiple transcript variants. [provided<br>by RefSeq, Mar 2010] |
