Summary: This gene encodes a member of the muscle segment homeobox gene family. The encoded

protein is a transcriptional repressor whose normal activity may establish a balance between

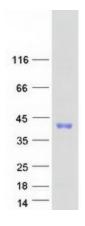

survival and apoptosis of neural crest-derived cells required for proper craniofacial

morphogenesis. The encoded protein may also have a role in promoting cell growth under certain conditions and may be an important target for the RAS signaling pathways. Mutations in this gene are associated with parietal foramina 1 and craniosynostosis type 2. [provided by
