Summary: The protein encoded by this gene is a helix-loop-helix (HLH) protein that can form

heterodimers with members of the basic HLH family of transcription factors. The encoded

protein has no DNA binding activity and therefore can inhibit the DNA binding and

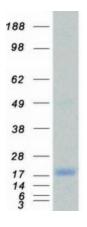

transcriptional activation ability of basic HLH proteins with which it interacts. This protein may play a role in cell growth, senescence, and differentiation. Two transcript variants encoding

different isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
