Summary: The protein encoded by this gene is a member of the serpin family of proteinase inhibitors. Members of this family maintain homeostasis by neutralizing overexpressed proteinase activity through their function as suicide substrates. This protein inhibits the neutrophil-derived proteinases neutrophil elastase, cathepsin G, and proteinase-3 and thus protects tissues from damage at inflammatory sites. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Aug 2012]

Linear correlations between plasma serpinB1 and insulin sensitivity index (SI) in 117 non-diabetic adult individuals. Both serpinB1 levels and SI are natural logs transformed. Pearson correlation coefficient (r) and the corresponding P values are shown. SerpinB1 was measured in plasma using ELISA with OriGene TP302138 SERPINB1 protein as the standard.
