#### DNAL1 (NM\_031427) Human Recombinant Protein - TP302768M

Cytogenetics: 14q24.3

RefSeq ORF: 453

Synonyms: C14orf168; CILD16; LC1

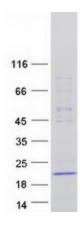

**Summary:** This gene encodes an axonemal dynein light chain which functions as a component of the

outer dynein arms complex. This complex acts as the molecular motor that provides the force to move cilia in an ATP-dependent manner. The encoded protein is expressed in tissues with motile cilia or flagella and may be involved in the movement of sperm flagella. Alternate

splicing results in multiple transcript variants.[provided by RefSeq, Jan 2011]

**Protein Pathways:** Huntington's disease
