**Summary:** The protein encoded by this gene is one of at least forty-one subunits that make up the

NADH-ubiquinone oxidoreductase complex. This complex is part of the mitochondrial respiratory chain and serves to catalyze the rotenone-sensitive oxidation of NADH and the reduction of ubiquinone. The encoded protein is one of three proteins found in the flavoprotein fraction of the complex. The specific function of the encoded protein is

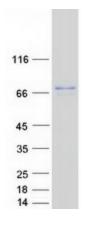

unknown. Two transcript variants encoding different isoforms have been found for this gene.
