The protein encoded by this gene is a CCA-adding enzyme which belongs to the tRNA Summary:

> nucleotidyltransferase/poly(A) polymerase family. This essential enzyme functions by catalyzing the addition of the conserved nucleotide triplet CCA to the 3' terminus of tRNA molecules. Mutations in this gene result in sideroblastic anemia with B-cell immunodeficiency, periodic fevers, and developmental delay. Alternative splicing results in multiple transcript

variants. [provided by RefSeq, Dec 2014]
