	PDE6D (NM_002601) Human Recombinant Protein – TP303172L
RefSeq Size:	1214
Cytogenetics:	2q37.1
RefSeq ORF:	450
Synonyms:	JBTS22; PDED
Summary:	This gene encodes the delta subunit of rod-specific photoreceptor phosphodiesterase (PDE), a key enzyme in the phototransduction cascade. A similar protein in cow functions in solubilizing membrane-bound PDE. In addition to its role in the PDE complex, the encoded protein is thought to bind to prenyl groups of proteins to target them to subcellular organelles called cilia. Mutations in this gene are associated with Joubert syndrome-22. Alternative splicing results in multiple splice variants. [provided by RefSeq, Mar 2014]
Protein Pathway	vs: Progesterone-mediated oocyte maturation, Purine metabolism
