| Tag: C-Myc/DDK                                                                                                                                                                            |
| Predicted MW: 20.1 kDa                                                                                                                                                                    |
| <b>Concentration:</b> >0.05 μg/μL as determined by microplate BCA method                                                                                                                  |
| Purity: > 80% as determined by SDS-PAGE and Coomassie blue staining                                                                                                                       |
| Buffer: 25 mM Tris-HCl, 100 mM glycine, pH 7.3, 10% glycerol                                                                                                                              |
| Preparation:Recombinant protein was captured through anti-DDK affinity column followed by<br>conventional chromatography steps.                                                           |
| <b>Note:</b> For testing in cell culture applications, please filter before use. Note that you may experience some loss of protein during the filtration process.                         |
| Storage: Store at -80°C.                                                                                                                                                                  |
| Stability:Stable for 12 months from the date of receipt of the product under proper storage and<br>handling conditions. Avoid repeated freeze-thaw cycles.                                |

| Summary:        | Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and<br>a large 60S subunit. Together these subunits are composed of 4 RNA species and<br>approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is<br>a component of the 60S subunit. The protein belongs to the L5P family of ribosomal proteins.<br>It is located in the cytoplasm. The protein probably associates with the 5S rRNA. Alternatively<br>spliced transcript variants encoding different isoforms have been found for this gene. As is<br>typical for genes encoding ribosomal proteins, there are multiple processed pseudogenes of<br>this gene dispersed through the genome. [provided by RefSeq, Dec 2010] |
