Summary: The protein encoded by this gene is a homodimeric integral membrane gelatinase belonging to

the serine protease family. It is selectively expressed in reactive stromal fibroblasts of

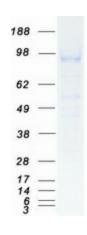

epithelial cancers, granulation tissue of healing wounds, and malignant cells of bone and soft tissue sarcomas. This protein is thought to be involved in the control of fibroblast growth or epithelial-mesenchymal interactions during development, tissue repair, and epithelial

carcinogenesis. Alternatively spliced transcript variants encoding different isoforms have been

found for this gene. [provided by RefSeq, Apr 2014]

Protein Families: Druggable Genome, Protease, Transmembrane
