| Synonyms: | NEM7 |
| Summary: | This gene encodes an intracellular protein that is involved in the regulation of actin-filament dynamics. This protein is a major component of intranuclear and cytoplasmic actin rods. It can bind G- and F-actin in a 1:1 ratio of cofilin to actin, and it reversibly controls actin polymerization and depolymerization in a pH-dependent manner. Mutations in this gene cause nemaline myopathy type 7, a form of congenital myopathy. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jul 2009] |
| Protein Families | : Druggable Genome |
| Protein Pathway | s: Axon guidance, Fc gamma R-mediated phagocytosis, Regulation of actin cytoskeleton |
