UniProt ID:Q9BW85RefSeq Size:1441Cytogenetics:19p13.3RefSeq ORF:969Synonyms:CCDC94

**Summary:** Part of the spliceosome which catalyzes two sequential transesterification reactions, first the

excision of the non-coding intron from pre-mRNA and then the ligation of the coding exons to form the mature mRNA (PubMed:29301961). Plays a role in stabilizing the structure of the spliceosome catalytic core and docking of the branch helix into the active site, producing 5'-exon and lariat intron-3'-intermediates (By similarity). May protect cells from TP53-dependent apoptosis upon dsDNA break damage through association with PRP19-CD5L complex

(PubMed:22952453).[UniProtKB/Swiss-Prot Function]
