Summary: This gene encodes a vitamin K-dependent plasma glycoprotein. The encoded protein is cleaved

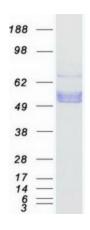

to its activated form by the thrombin-thrombomodulin complex. This activated form contains a serine protease domain and functions in degradation of the activated forms of coagulation factors V and VIII. Mutations in this gene have been associated with thrombophilia due to protein C deficiency, neonatal purpura fulminans, and recurrent venous thrombosis.[provided

by RefSeq, Dec 2009]

**Protein Families:** Druggable Genome, Protease

**Protein Pathways:** Complement and coagulation cascades
