Summary: The protein encoded by this gene is a bifunctional enzyme that catalyzes the oxidative

conversion of delta(5)-ene-3-beta-hydroxy steroid, and the oxidative conversion of

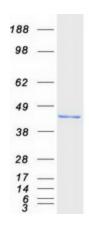

ketosteroids. It plays a crucial role in the biosynthesis of all classes of hormonal steroids. This gene is predominantly expressed in the adrenals and the gonads. Mutations in this gene are associated with 3-beta-hydroxysteroid dehydrogenase, type II, deficiency. Alternatively spliced

transcript variants have been found for this gene. [provided by RefSeq, Oct 2009]
