	Troponin C1 (TNNC1) (NM_003280) Human Recombinant Protein – TP307014
Cytogenetics:	3p21.1
RefSeq ORF:	483
Synonyms:	CMD1Z; CMH13; TN-C; TNC; TNNC
Summary:	Troponin is a central regulatory protein of striated muscle contraction, and together with tropomyosin, is located on the actin filament. Troponin consists of 3 subunits: Tnl, which is the inhibitor of actomyosin ATPase; TnT, which contains the binding site for tropomyosin; and TnC, the protein encoded by this gene. The binding of calcium to TnC abolishes the inhibitory action of Tnl, thus allowing the interaction of actin with myosin, the hydrolysis of ATP, and the generation of tension. Mutations in this gene are associated with cardiomyopathy dilated type 1Z. [provided by RefSeq, Oct 2008]
Protein Pathway	rs: Calcium signaling pathway, Cardiac muscle contraction, Dilated cardiomyopathy, Hypertrophic cardiomyopathy (HCM)
