Summary: This gene encodes D-2hydroxyglutarate dehydrogenase, a mitochondrial enzyme belonging to

> the FAD-binding oxidoreductase/transferase type 4 family. This enzyme, which is most active in liver and kidney but also active in heart and brain, converts D-2-hydroxyglutarate to 2ketoglutarate. Mutations in this gene are present in D-2-hydroxyglutaric aciduria, a rare recessive neurometabolic disorder causing developmental delay, epilepsy, hypotonia, and

dysmorphic features. [provided by RefSeq, Jul 2008]
