Summary:	This gene encodes an oxidoreductase that promotes fatty-acid oxidation, with concomitant inflammasome activation, mitochondrial and NADPH-oxidase-dependent reactive oxygen species production, and bactericidal activity of macrophages. The encoded protein forms a complex with fatty acid synthase on peroxisomes and is thought to be modulated by peroxisome proliferator-activated receptor signaling events. Naturally occurring mutations in this gene are associated with inflammatory bowel disease, Behcet's disease, leprosy, ulcerative colitis, early-onset Crohn's disease, and systemic juvenile idiopathic arthritis. Analysis of human recombinant FAMIN laccase activity. Four phenolic substrates (DMP, Guaiacol, L-DOPA and SGZ) were tested to evaluate laccase activity of the C-terminal MYC/DDK-tagged recombinant FAMIN protein (OriGene [TP307834]). Data are representative of three independent experiments. Figure cited from PLoS ONE, PMID: 27959965
