Summary: This gene encodes a basic helix-loop-helix transcription factor which is expressed in

oligodendroglial tumors of the brain. The protein is an essential regulator of ventral neuroectodermal progenitor cell fate. The gene is involved in a chromosomal translocation t(14;21)(q11.2;q22) associated with T-cell acute lymphoblastic leukemia. Its chromosomal location is within a region of chromosome 21 which has been suggested to play a role in

learning deficits associated with Down syndrome. [provided by RefSeq, Jul 2008]
