Summary:	This gene encodes a subunit of the heterodimeric cytokine interleukin 23 (IL23). IL23 is composed of this protein and the p40 subunit of interleukin 12 (IL12B). The receptor of IL23 is formed by the beta 1 subunit of IL12 (IL12RB1) and an IL23 specific subunit, IL23R. Both IL23 and IL12 can activate the transcription activator STAT4, and stimulate the production of interferon-gamma (IFNG). In contrast to IL12, which acts mainly on naive CD4(+) T cells, IL23 preferentially acts on memory CD4(+) T cells. [provided by RefSeq, Jul 2008]

Protein Pathway	S: Cytokine-cytokine receptor interaction, Jak-STAT signaling pathway

Identification of IL-23 cleavage sites by Western blot. IL-23 heterodimer (IL-23) and IL-23 monomer (IL-23p19) (OriGene [TP309680]) were incubated with or without TEV L2F. Reaction mixtures were subjected to Western blot with an anti-IL-23p19 monoclonal antibody. Figure cited from Nat Commun, PMID: 29038472

Cultured mouse mononuclear splenocytes secrete IL-17 in response to human IL-23 (OriGene [TP309680]) in the media. Addition of antibodies that neutralize IL-23 to the cell culture media prevents this response. Figure cited from Nat Commun, PMID: 29038472

Identification of two cleavage sites of TEV L2F protease within IL-23 monomer (OriGene [TP309680]) by mass spectrometry. Figure cited from Nat Commun, PMID: 29038472

Coomassie blue staining of purified IL23A protein (Cat# [TP309680]). The protein was produced from HEK293T cells transfected with IL23A cDNA clone (Cat# [RC209680]) using MegaTran 2.0 (Cat# [TT210002]).
