Summary: This gene encodes an integral membrane protein that transports the neurotransmitter

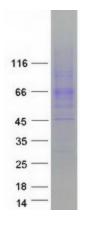

serotonin from synaptic spaces into presynaptic neurons. The encoded protein terminates the action of serotonin and recycles it in a sodium-dependent manner. This protein is a target of psychomotor stimulants, such as amphetamines and cocaine, and is a member of the sodium payretransmitter symporter family. A repeat length polymorphism in the promoter of

sodium:neurotransmitter symporter family. A repeat length polymorphism in the promoter of this gene has been shown to affect the rate of serotonin uptake. There have been conflicting results in the literature about the possible effect, if any, that this polymorphism may play in

behavior and depression. [provided by RefSeq, May 2019]
